HTTP Verbs and Status Codes

GET politely asks the server, “Can I see what you already have?”
It only reads the data safely, like window-shopping a graph.

POST brings something brand new, like sending a form with flair,
It creates fresh data on the server and proudly leaves it there.

PUT fixes what already exists, updating details left and right,
While DELETE removes old data completely—gone from sight.

200 means “Success!” everything worked out just fine,
201 says “Created!”, a new resource born in time.

204 means done with nothing to show, a quiet success instead,
But a missing id in the Resolutions API earns a 404—“Not Found,” it said.
